

```
std::type_identity< std::variant< Ts... > >
```

```
std::type_identity< std::variant< Ts... > >
```

```
templa::convert::convert_to_variant< From< Ts... > >
```

The diagram illustrates a conversion from a templated variant to a standard variant. A box at the bottom contains the code `templa::convert::convert_to_variant< From< Ts... > >`. Two vertical lines extend upwards from the ends of this box, meeting a horizontal line. From the center of this horizontal line, two arrows point upwards to the bottom of two separate boxes. Both boxes contain the code `std::type_identity< std::variant< Ts... > >`, indicating that the conversion function produces a standard variant type.
